Casement or "Crank-Out" windows require a special style of awning that will provide shade and protection for the window, and still allow the window to open and close. An Alcan Aurora Casement Awning has a special shape and design that can be installed around a casement window and still allow complete operation of the window. Usually, the top of an awning is installed on the window casing, immediately above the sash. For a Casement window, the awning must be installed above the casement at the top and also past the sides of the window onto the siding. This awning is mounted out on the siding -- not on the window casing.

Measuring for Casement Awnings:

1. Measure the total width and height of the window, including the full width of the window casing trim on the window. Also note the "swing out" of the sash (the distance the sash protrudes out when fully opened.)
2. Check the "Mounting Space Required" chart below and note the "Inches Above" required for your window size. (Make sure that you have that much space available!)
3. Select the Drop of awning that will cover 1/2 of the height of the window, plus the "Inches Above" measurement. (Example: a 40" tall window would need about 20" of drop. It has a Swing Out of 16", so it requires that the awning be mounted 7" above the window. The proper drop would be about 27".)
4. Select a Width that is at least 4" wider than the outside width of the window including the window casing trim.

Suggested RETAIL Price 5-15-2000, subject to change without notice.
